Exploit Java RMI

---

Daniele Zizzi

# Exploit su Java RMI

In questo progetto, andrò a sfruttare la vulnerabilità, sul servizio offerto dalla porta 1099, Java RMI. Quindi punterò ad ottenere una shell meterpreter sul sistema target, che in questo caso è metasploit.

# DEFIZIONE EXPLOIT

Un exploit è un programma informatico, un software o una sequenza di comandi che sfrutta un errore o una vulnerabilità per provocare un certo comportamento nel software, nell'hardware o in qualsiasi dispositivo elettronico. Questi comportamenti possono includere l'assunzione del controllo di un sistema, la concessione di privilegi di amministratore a un intruso o l'avvio di attacchi di negazione del servizio (DoS o DDoS)

Ho configurato gli ip delle due macchine, kali e meta, affinché fossero nella stessa rete. E ne ho testato la connettività usando un semplice ping.

The image shows two side-by-side terminal windows. The left window is a Kali Linux terminal with the title 'daniele@kali: ~'. It shows the configuration of the `/etc/network/interfaces` file using nano 7.2. The configuration sets the loopback interface `lo` to `127.0.0.1` and the primary interface `eth0` to `192.168.11.1` with a netmask of `255.255.255.0` and a gateway of `192.168.11.1`. Below the configuration, a ping test is performed from `192.168.11.1` to `192.168.11.112`, showing four successful pings with varying response times. The output includes 'PING 192.168.11.112 (192.168.11.112) 56(84) bytes of data.' and '4 packets transmitted, 4 received, 0% packet loss, time 3055ms'. The right window is a Metasploit VM terminal with the title 'Metasploit [In esecuzione] - Oracle VM VirtualBox'. It shows the same `/etc/network/interfaces` file being edited with nano 2.0.7. The configuration sets the loopback interface `lo` to `127.0.0.1` and the primary interface `eth0` to `192.168.11.112` with a netmask of `255.255.255.0` and a broadcast address of `192.168.11.255`. The status bar at the bottom of the Metasploit window indicates '[ Wrote 14 lines ]'.

Ho effettuato una scansione con nmap, utilizzando il comando "nmap -sT", in modo da effettuare una connessione tcp completa(3-way hand shake), con ping abilitato, in modo da ottenere informazioni affidabili. Dall'output risulta aperta la porta 1099(rmiregistry), dove andrò ad effettuare l'exploit.

```
(daniele@kali)-[~]  
$ nmap -sT 192.168.11.112  
Starting Nmap 7.94 ( https://nmap.org )  
mass_dns: warning: Unable to determine local DNS name

```

Quindi ho avviato la shell metasploit, ed ho cercato l'exploit di cui avevo bisogno. In questo caso java\_rmi\_server. E l'ho selezionato specificandone il path.

Di default, viene caricato il payload "reverse\_tcp" con l'utilizzo di meterpreter, che effettua un attacco di tipo reverse shell. Pertanto, il pc attaccante si mette in ascolto, ed il pc target instaura una connessione con esso. Aggirando così il firewall perimetrale della vittima. Ed apre una shell meterpreter con privilegi di amministratore.

```
(daniele@kali)-[~]

Check supported:
Yes

Basic options:
  Name      Current Setting  Required  Description
  --      -
  HTTPDELAY  10               yes       Time that the HTTP Server will wait for the payload request
  RHOSTS    1099             yes       The target host(s), see https://docs.metasploit.com/docs/using-metasploit/basics/using-metasploit.html
  RPORT     0.0.0.0          yes       The target port (TCP)
  SRVHOST   0.0.0.0          yes       The local host or network interface to listen on. This must be an address on the local machine or 0.0.0.0 to listen on all addresses.
  SRVPORT   8080             yes       The local port to listen on.
  SSL       false            no        Negotiate SSL for incoming connections
  SSLCert   no               no        Path to a custom SSL certificate (default is randomly generated)
  URIPATH   no               no        The URI to use for this exploit (default is random)

Payload information:
Avoid: 0 characters

Description:
This module takes advantage of the default configuration of the RMI Registry and RMI Activation services, which allow loading classes from any remote (HTTP) URL. As it invokes a method in the RMI Distributed Garbage Collector which is available via every RMI endpoint, it can be used against both rmiregistry and rmid, and against most other (custom) RMI endpoints as well.

Note that it does not work against Java Management Extension (JMX) ports since those do not support remote class loading, unless another RMI endpoint is active in the same Java process.

RMI method calls do not support or require any sort of authentication.

```

Lancio l'exploit, ed ottengo la sessione meterpreter. Una volta ottenuta la shell, ho il comando del sistema target. Per verificarlo, visualizzo le informazioni sul sistema, utilizzabili per sfruttare le vulnerabilità presenti nel sistema con tale versione. La sua configurazione di rete, per risalire all'indirizzo mac, ed eventuale ip del gateway. La tabella di route, dove risiedono ip, subnet, interfacce utilizzate, le rotte di destinazione e la metrica.
